Project Name	Automated Network Request Management in Servicenow
Maximum Marks	4 Marks

Solution Architecture

The **Automated Network Request Management in ServiceNow** solution is built on the ServiceNow platform using the **Service Catalog**, **Flow Designer**, **Approval Workflow**, and a **Network Database**. Users submit network requests through the self-service portal. The system validates the request, captures the required information, creates a database record, and automatically routes it to the appropriate approver. After approval, the request is assigned to the IT team for fulfillment, while email notifications keep users informed throughout the process. Finally, the request status is updated in the Network Database, providing complete visibility and efficient management of network service requests.
